

Bridgeway Aerial* has specialised in thermal imaging of solar plants for a number of years. Working with the UK's largest Operation and Maintenance company, we have scanned hundreds of megawatts of solar plants.

With the objective of providing a fault identification and categorisation analysis of each plant, an aerial scan is efficient, accurate and valuable.

Using specific thermal software tools we are able to geolocate panels and measure temperatures from the air.

*N.B. Prior to January 2017, the company name was AM-UAS Ltd.
